What is a black hole ?

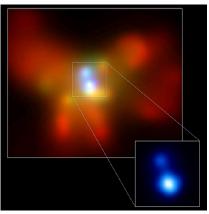

... for the astrophysicist: a very deep gravitational potential well

[J.A. Marck, CQG 13, 393 (1996)]

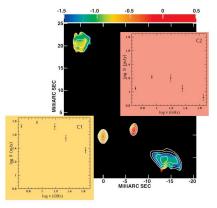

What is a black hole ?

... for the astrophysicist: a very deep gravitational potential well

Binary BH in galaxy NGC 6240 d = 1.4 kpc

[Komossa et al., ApJ 582, L15 (2003)]

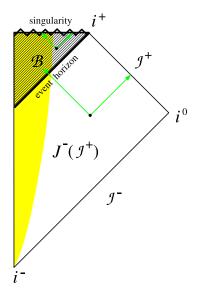

Binary BH in radio galaxy 0402+379 d = 7.3 pc

[Rodriguez et al., ApJ in press, astro-ph/0604042]

Eric Gourgoulhon (LUTH)

What is a black hole ?

... for the mathematical physicist:

$$\mathcal{B} := \mathscr{M} - J^{-}(\mathscr{I}^{+})$$

i.e. the region of spacetime where light rays cannot escape to infinity

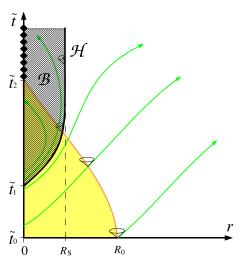

- $\mathcal{M} = asymptotically flat manifold$
- $\mathscr{I}^+ = future null infinity$

•
$$J^-(\mathscr{I}^+)=\mathsf{causal}$$
 past of \mathscr{I}^+

event horizon: $\mathcal{H} := \dot{J}^{-}(\mathscr{I}^{+})$ (boundary of $J^{-}(\mathscr{I}^{+})$)

 $\mathcal{H} \text{ smooth} \Longrightarrow \mathcal{H} \text{ null hypersurface}$

What is a black hole ?

... for the mathematical physicist:

 $\mathcal{B} := \mathscr{M} - J^{-}(\mathscr{I}^{+})$

i.e. the region of spacetime where light rays cannot escape to infinity

- $\mathcal{M} = asymptotically flat manifold$
- $\mathscr{I}^+ = future null infinity$

•
$$J^-(\mathscr{I}^+)=\mathsf{causal}$$
 past of \mathscr{I}^+

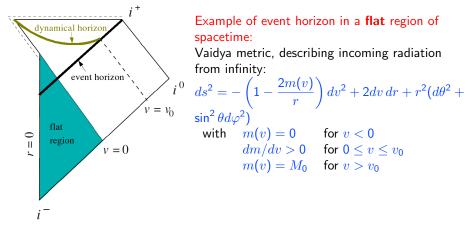

event horizon: $\mathcal{H} := \dot{J}^-(\mathscr{I}^+)$ (boundary of $J^-(\mathscr{I}^+)$)

 $\mathcal H \mbox{ smooth} \Longrightarrow \mathcal H \mbox{ null hypersurface}$

Image: A math a math

This is a highly non-local definition !

The determination of the boundary of $J^{-}(\mathscr{I}^{+})$ requires the knowledge of the entire future null infinity. Moreover this is not locally linked with the notion of strong gravitational field:

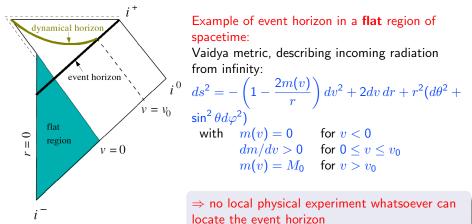

[Ashtekar & Krishnan, LRR 7, 10 (2004)]

Image: A math a math

Another non-local feature: teleological nature of event horizons

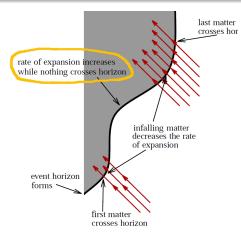

[Booth, Can. J. Phys. 83, 1073 (2005)]

The classical black hole boundary, i.e. the event horizon, responds in advance to what will happen in the future.

Local characterizations of black holes

Recently a **new paradigm** appeared in the theoretical approach of black holes: instead of *event horizons*, black holes are described by

- trapping horizons (Hayward 1994)
- isolated horizons (Ashtekar et al. 1999)
- dynamical horizons (Ashtekar and Krishnan 2002)

All these concepts are **local** and are based on the notion of trapped surfaces

Motivations: quantum gravity, numerical relativity

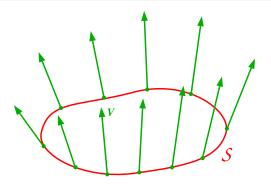

What is a trapped surface ? 1/ Expansion of a surface along a normal vector field

 Consider a spacelike 2-surface S (induced metric: q)

What is a trapped surface ? 1/ Expansion of a surface along a normal vector field

- Consider a spacelike 2-surface S (induced metric: q)
- Take a vector field v defined on S and normal to S at each point
- ε being a small parameter, displace the point p by the vector εv to the point p'

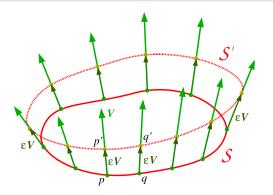

What is a trapped surface ? 1/ Expansion of a surface along a normal vector field

- Consider a spacelike 2-surface S (induced metric: q)
- Take a vector field v defined on S and normal to S at each point
- ε being a small parameter, displace the point p by the vector εv to the point p'

 Do the same for each point in S, keeping the value of ε fixed

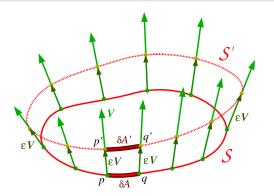

What is a trapped surface ? 1/ Expansion of a surface along a normal vector field

- Consider a spacelike 2-surface S (induced metric: q)
- Take a vector field v defined on S and normal to S at each point
- ε being a small parameter, displace the point p by the vector εv to the point p'
- Do the same for each point in *S*, keeping the value of ε fixed
- This defines a new surface S' (Lie dragging)

A D > A A

What is a trapped surface ? 1/ Expansion of a surface along a normal vector field

- Consider a spacelike 2-surface S (induced metric: q)
- 2 Take a vector field v defined on \mathcal{S} and normal to \mathcal{S} at each point
- $\bigcirc \varepsilon$ being a small parameter, displace the point p by the vector εv to the point p'
- O the same for each point in \mathcal{S} , keeping the value of ε fixed
- This defines a new surface S'(Lie dragging)

At each point, the expansion of S along v is defined from the relative change in $\theta^{(\boldsymbol{v})} := \lim_{\varepsilon \to 0} \frac{1}{\varepsilon} \frac{\delta A' - \delta A}{\delta A} = \mathcal{L}_{\boldsymbol{v}} \ln \sqrt{q} = q^{\mu \nu} \nabla_{\mu} v_{\nu}$

the area element δA :

What is a trapped surface ? 2/ The definition

 $\mathcal{S}:$ closed (i.e. compact without boundary) spacelike 2-dimensional surface embedded in spacetime (\mathscr{M},g)

What is a trapped surface ? ²/ The definition</sup>

 $\mathcal S$: closed (i.e. compact without boundary) spacelike 2-dimensional surface embedded in spacetime $(\mathscr M,g)$

trapped surface = **local** concept characterizing very strong gravitational fields

Eric Gourgoulhon (LUTH)

Link with apparent horizons

A closed spacelike 2-surface S is said to be outer trapped (resp. marginally outer trapped (MOTS)) iff [Hawking & Ellis 1973]

- the notions of *interior* and *exterior* of S can be defined (for instance spacetime asymptotically flat) ⇒ ℓ is chosen to be the *outgoing* null normal and k to be the *ingoing* one
- $\theta^{(\ell)} < 0$ (resp. $\theta^{(\ell)} = 0$)

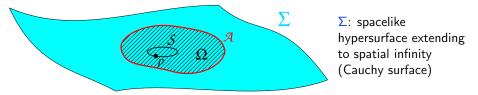

Image: A math a math

Link with apparent horizons

A closed spacelike 2-surface S is said to be outer trapped (resp. marginally outer trapped (MOTS)) iff [Hawking & Ellis 1973]

the notions of *interior* and *exterior* of S can be defined (for instance spacetime asymptotically flat) ⇒ ℓ is chosen to be the *outgoing* null normal and k to be the *ingoing* one

•
$$\theta^{(\ell)} < 0$$
 (resp. $\theta^{(\ell)} = 0$)

outer trapped region of Σ : Ω = set of points $p \in \Sigma$ through which there is a outer trapped surface S lying in Σ

apparent horizon in $\Sigma : \ \mathcal{A} = \text{connected component of the boundary of } \Omega$

Proposition [Hawking & Ellis 1973]: \mathcal{A} smooth $\Longrightarrow \mathcal{A}$ is a MOTS

Connection with singularities and black holes

Proposition [Penrose (1965)]:

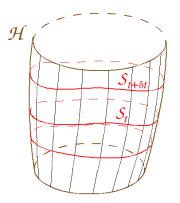

provided that the weak energy condition holds, \exists a trapped surface $S \implies \exists$ a singularity in (\mathcal{M}, g) (in the form of a future inextendible null geodesic)

Proposition [Hawking & Ellis (1973)]: provided that the cosmic censorship conjecture holds, \exists a trapped surface $S \implies \exists$ a black hole \mathcal{B} and $S \subset \mathcal{B}$

Image: A math a math

Local definitions of "black holes"

A hypersurface \mathcal{H} of (\mathcal{M}, g) is said to be

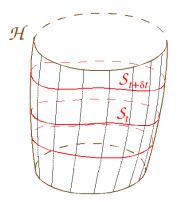

a future outer trapping horizon (FOTH) iff

(i) \mathcal{H} foliated by marginally trapped 2-surfaces ($\theta^{(k)} < 0$ and $\theta^{(\ell)} = 0$) (ii) $\mathcal{L}_{k} \theta^{(\ell)} < 0$ (locally outermost trapped surf.)

[Hayward, PRD 49, 6467 (1994)]

Local definitions of "black holes"

A hypersurface $\mathcal H$ of $(\mathscr M, \boldsymbol g)$ is said to be

a future outer trapping horizon (FOTH) iff

 (i) *H* foliated by marginally trapped 2-surfaces
 (θ^(k) < 0 and θ^(ℓ) = 0)
 (ii) *L_k* θ^(ℓ) < 0 (locally outermost trapped surf.)

 [Hayward, PRD 49, 6467 (1994)]

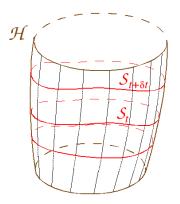

• a dynamical horizon (DH) iff

(i) ${\cal H}$ foliated by marginally trapped 2-surfaces (ii) ${\cal H}$ spacelike

[Ashtekar & Krishnan, PRL 89 261101 (2002)]

Local definitions of "black holes"

[Ashtekar & Krishnan, PRL 89 261101 (2002)]

- a non-expanding horizon (NEH) iff
 - (i) \mathcal{H} is null (null normal ℓ) (ii) $\theta^{(\ell)} = 0$ [Hájiček (1973)]

Local definitions of "black holes"

A hypersurface $\mathcal H$ of $(\mathscr M, \boldsymbol g)$ is said to be

a future outer trapping horizon (FOTH) iff

 (i) *H* foliated by marginally trapped 2-surfaces
 (θ^(k) < 0 and θ^(ℓ) = 0)
 (ii) *L_k* θ^(ℓ) < 0 (locally outermost trapped surf.)

 [Hayward, PRD 49, 6467 (1994)]

• a dynamical horizon (DH) iff

(i) ${\cal H}$ foliated by marginally trapped 2-surfaces (ii) ${\cal H}$ spacelike

[Ashtekar & Krishnan, PRL 89 261101 (2002)]

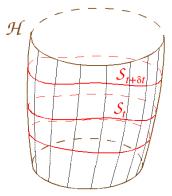

- a non-expanding horizon (NEH) iff
 - (i) \mathcal{H} is null (null normal ℓ)
 - (ii) $\theta^{(\ell)} = 0$ [Hájiček (1973)]
- an isolated horizon (IH) iff
 - (i) \mathcal{H} is a non-expanding horizon

(ii) \mathcal{H} 's full geometry is not evolving along the null generators: $[\mathcal{L}_{\ell}, \hat{\nabla}] = 0$

[Ashtekar, Beetle & Fairhurst, CQG 16, L1 (1999]]

Local definitions of "black holes"

A hypersurface $\mathcal H$ of $(\mathscr M, \boldsymbol g)$ is said to be

BH in equilibrium (e.g. Kerr) = IH BH out of equilibrium = DH generic BH = FOTH a future outer trapping horizon (FOTH) iff

 (i) *H* foliated by marginally trapped 2-surfaces
 (θ^(k) < 0 and θ^(ℓ) = 0)
 (ii) *L_k* θ^(ℓ) < 0 (locally outermost trapped surf.)

 [Hayward, PRD 49, 6467 (1994)]

• a dynamical horizon (DH) iff

(i) ${\cal H}$ foliated by marginally trapped 2-surfaces (ii) ${\cal H}$ spacelike

[Ashtekar & Krishnan, PRL 89 261101 (2002)]

- a non-expanding horizon (NEH) iff
 - (i) \mathcal{H} is null (null normal ℓ) (ii) $\theta^{(\ell)} = 0$ [Hájiček (1973)]
- an isolated horizon (IH) iff
 - (i) ${\mathcal H}$ is a non-expanding horizon
 - (ii) $\mathcal{H}'s$ full geometry is not evolving along the null generators: $[\boldsymbol{\mathcal{L}}_{\boldsymbol{\ell}}\,, \boldsymbol{\hat{\nabla}}]=0$

[Ashtekar, Beetle & Fairhurst, CQG 16, L1 (1999)]

Dynamics of these new horizons

The *trapping horizons* and *dynamical horizons* have their **own dynamics**, ruled by Einstein equations.

In particular, one can establish for them

• existence and (partial) uniqueness theorems

[Andersson, Mars & Simon, PRL 95, 111102 (2005)],

[Ashtekar & Galloway, Adv. Theor. Math. Phys. 9, 1 (2005)]

- first and second laws of black hole mechanics
 [Ashtekar & Krishnan, PRD 68, 104030 (2003)], [Hayward, PRD 70, 104027 (2004)]
- a viscous fluid bubble analogy ("membrane paradigm" as for the event horizon), leading to a Navier-Stokes-like equation and a **positive** bulk viscosity (event horizon = negative bulk viscosity)
 [Gourgoulhon, PRD 72, 104007 (2005)], [Gourgoulhon & Jaramillo, PRD 74, 087502 (2006)]

Reviews: [Ashtekar & Krishnan, Liv. Rev. Relat. 7, 10 (2004)], [Booth, Can. J. Phys. 83, 1073 (2005)], [Gourgoulhon & Jaramillo, Phys. Rep. 423, 159 (2006)]

Geometry of hypersurface foliations by spacelike 2-surfaces

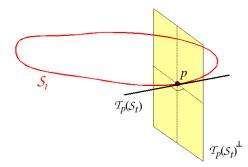

Closed spacelike surfaces

 $\mathcal S$: closed (i.e. compact without boundary) spacelike 2-dimensional surface embedded in spacetime $(\mathscr M,g)$

 ${\mathcal S}$ spacelike \iff metric q induced by g is positive definite

 ${\pmb q}$ not degenerate \Longrightarrow orthogonal decomposition of the tangent space at any $p\in \mathscr{M}$:

 $\mathcal{T}_p(\mathscr{M}) = \mathcal{T}_p(\mathcal{S}) \oplus \mathcal{T}_p(\mathcal{S})^{\perp}$

- \boldsymbol{q} : induced metric on \mathcal{S} , components: $q_{lphaeta}$
- $ec{q}$: orthogonal projector onto ${\cal S}$, components: q^{lpha}_{eta}

A D > A B > A B

Projection operator $ec{q}^*$

 $oldsymbol{A}$: tensor of covariance type (m,n)

 $ec{q}^*A$: tensor of same covariance type, defined by

 $\left(\bar{q}^*A\right)^{\alpha_1\dots\alpha_m}_{\beta_1\dots\beta_n} := q^{\alpha_1}_{\ \mu_1}\dots q^{\alpha_m}_{\ \mu_m} q^{\nu_1}_{\ \beta_1}\dots q^{\nu_n}_{\ \beta_n} A^{\mu_1\dots\mu_m}_{\ \nu_1\dots\nu_n}$

Remark: for a vector: $\vec{q}^* v = \vec{q}(v)$ for a 1-form, $\vec{q}^* \omega = \omega \circ \vec{q}$

Definition: a tensor A is tangent to S iff $\vec{q}^*A = A$.

(日) (同) (三) (三)

Expansion and shear along normal vectors

Let v be a vector field on \mathcal{M} , defined at least at S and everywhere normal to S. NB: v is not assumed to be null

Deformation tensor of S along v: $\Theta^{(v)} := \vec{q}^* \nabla \underline{v}$ or $\Theta^{(v)}_{\alpha\beta} := \nabla_{\nu} v_{\mu} q^{\mu}_{\ \alpha} q^{\nu}_{\ \beta}$

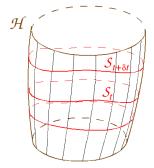

v normal to a 2-surface $(S) \Longrightarrow \Theta^{(v)}$ is a symmetric bilinear form $Prop: \Theta^{(v)} = \frac{1}{2} \bar{q}^* \mathcal{L}_v q$

Decomposition into traceless part (shear $\sigma^{(v)}$) and trace part (expansion $\theta^{(v)}$): $\Theta^{(v)} = \sigma^{(v)} + \frac{1}{2} \theta^{(v)} q \text{ with } \theta^{(v)} := q^{\mu\nu} \Theta^{(v)}_{\mu\nu} = \mathcal{L}_v \ln \sqrt{q}, q := \det q_{ab}$

Prop: $\mathcal{L}_{v} \, {}^{s} \epsilon = \theta^{(v) \, s} \epsilon$ with ${}^{s} \epsilon$ surface element of (\mathcal{S}, q) : ${}^{s} \epsilon = \sqrt{q} \, \mathbf{d} x^{2} \wedge \mathbf{d} x^{3}$ \implies hence the name *expansion*

Foliation of a hypersurface by spacelike 2-surfaces

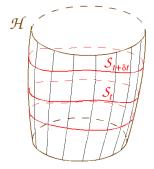

hypersurface $\mathcal{H} =$ submanifold of spacetime (\mathcal{M}, g) of codimension 1 \mathcal{H} can be $\begin{cases} \text{spacelike} \\ \text{null} \\ \text{timelike} \end{cases}$ $\mathcal{H} = \bigcup_{t \in \mathbb{R}} \mathcal{S}_t$ $\mathcal{S}_t =$ spacelike 2-surface

intrinsic viewpoint adopted here (i.e. not relying on extra-structure such as a 3+1 foliation)

Evolution vector on the horizon

Vector field h on $\mathcal H$ defined by

- (i) h is tangent to ${\cal H}$
- (ii) h is orthogonal to S_t

• (iii)
$$\mathcal{L}_{h} t = h^{\mu} \partial_{\mu} t = \langle \mathbf{d} t, \mathbf{h} \rangle = 1$$

NB: (iii) \implies the 2-surfaces S_t are Lie-dragged by h

Lie derivatives along $m{h}$

Since the 2-surfaces S_t are Lie-dragged by h, so are their tangent vectors:

 $orall oldsymbol{v} \in \mathcal{T}(\mathcal{S}_t), \; oldsymbol{\mathcal{L}}_{oldsymbol{h}} \: oldsymbol{v} \in \mathcal{T}(\mathcal{S}_t)$

i.e. \mathcal{L}_{h} = internal operator on $\mathcal{T}(\mathcal{S}_{t})$ Extension to 1-forms in $\mathcal{T}^{*}(\mathcal{S}_{t})$:

 $orall oldsymbol{v} \in \mathcal{T}(\mathcal{S}_t), \hspace{1em} \langle oldsymbol{\mathcal{L}}_{oldsymbol{h}} \, oldsymbol{\omega}, oldsymbol{v}
angle := oldsymbol{\mathcal{L}}_{oldsymbol{h}} \, \langle oldsymbol{\omega}, oldsymbol{v}
angle - \langle oldsymbol{\omega}, oldsymbol{\mathcal{L}}_{oldsymbol{h}} \, oldsymbol{v}
angle
angle.$

Extension to any tensor A tangent to S_t by tensor products Definition:

 ${}^{\mathcal{S}}\!\mathcal{L}_h\,A := ar{q}^*\mathcal{L}_h\,A = ar{q}^*\mathcal{L}_h\,ar{q}^*A$

Norm of h and type of $\mathcal H$

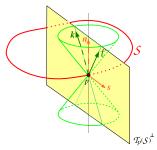

Definition:
$$C := \frac{1}{2} h \cdot h$$

 \mathcal{H} is spacelike $\iff C > 0 \iff h$ is spacelike
 \mathcal{H} is null $\iff C = 0 \iff h$ is null
 \mathcal{H} is timelike $\iff C < 0 \iff h$ is timelike.

Frames normal to \mathcal{S}_t

Two natural types of choice for a vector basis of $\mathcal{T}_p(\mathcal{S}_t)^\perp$:

• an orthonormal basis (n, s) (n = timelike, s = spacelike):

 $n \cdot n = -1, \quad s \cdot s = 1, \quad n \cdot s = 0$

 a pair linearly independent future-directed null vectors (*l*, *k*):

< ロ > < 同 > < 三 > < 三

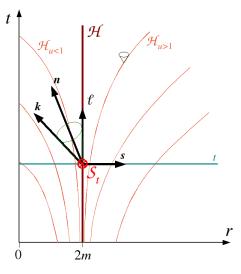

$$\boldsymbol{\ell} \cdot \boldsymbol{\ell} = \boldsymbol{0}, \quad \boldsymbol{k} \cdot \boldsymbol{k} = \boldsymbol{0}, \quad \boldsymbol{\ell} \cdot \boldsymbol{k} =: -e^{\sigma}$$

Degrees of freedom:

a boost: $\begin{cases} n' = \cosh \eta \, n + \sinh \eta \, s \\ s' = \sinh \eta \, n + \cosh \eta \, s \end{cases}, \quad \eta \in \mathbb{R}$ **a** rescaling: $\begin{cases} \ell' = \lambda \, \ell, \quad \lambda > 0 \\ k' = \mu \, k, \quad \mu > 0 \end{cases}$

Orthogonal projector: $\vec{q} = \mathbf{1} + \langle \underline{n}, . \rangle \, n - \langle \underline{s}, . \rangle \, s = \mathbf{1} + e^{-\sigma} \langle \underline{k}, . \rangle \, \boldsymbol{\ell} + e^{-\sigma} \langle \underline{\ell}, . \rangle \, \boldsymbol{k}$

Example of normal frames

 $\mathcal{H} =$ event horizon of Schwarzschild black hole $\mathcal{S}_t =$ slice of constant Eddington-Finkelstein time

Second fundamental tensor of S_t

Tensor \mathcal{K} of type (1,2) relating the covariant derivative of a vector tangent to S_t taken by the spacetime connection ∇ to that taken by the connection \mathcal{D} in S_t compatible with the induced metric q:

 $orall (oldsymbol{u},oldsymbol{v})\in \mathcal{T}(\mathcal{S}_t)^2, \quad oldsymbol{
abla}_{oldsymbol{u}}oldsymbol{v}=oldsymbol{\mathcal{D}}_{oldsymbol{u}}oldsymbol{v}+\mathcal{K}(oldsymbol{u},oldsymbol{v})$

Prop:

$$\begin{split} \mathcal{K}^{\alpha}_{\ \beta\gamma} &= \nabla_{\mu} q^{\alpha}_{\ \nu} \ q^{\mu}_{\ \beta} q^{\nu}_{\ \gamma} \\ \mathcal{K}^{\alpha}_{\ \beta\gamma} &= n^{\alpha} \Theta^{(\boldsymbol{n})}_{\beta\gamma} - s^{\alpha} \Theta^{(\boldsymbol{s})}_{\beta\gamma} = e^{-\sigma} \left(k^{\alpha} \Theta^{(\boldsymbol{\ell})}_{\beta\gamma} + \ell^{\alpha} \Theta^{(\boldsymbol{k})}_{\beta\gamma} \right) \\ Remark: \text{ for a hypersurface of normal } \boldsymbol{n} \text{ and extrinsic curvature } \boldsymbol{K}, \\ \mathcal{K}^{\alpha}_{\ \beta\gamma} &= -n^{\alpha} K_{\beta\gamma} \end{split}$$

Normal fundamental forms

Extrinsic geometry of \mathcal{S}_t not entirely specified by \mathcal{K} (contrary to the hypersurface case)

 \mathcal{K} involves only the deformation tensors $\Theta^{(.)}$ of the normals to $\mathcal{S}_t \Longrightarrow \mathcal{K}$ encodes only the part of the variation of \mathcal{S}_t 's normals which is parallel to \mathcal{S}_t

Variation of the two normals with respect to each other: encoded by the **normal fundamental forms** (also called *external rotation coefficients* or *connection on the normal bundle*, or if \mathcal{H} is null, *Hájíček 1-form*):

$$\begin{aligned} & \mathbf{\Omega}^{(n)} := s \cdot \nabla_{\vec{q}} \, n \\ & \mathbf{\Omega}^{(s)} := n \cdot \nabla_{\vec{q}} \, s \end{aligned} \quad \text{or} \quad \Omega^{(n)}_{\alpha} := s_{\mu} \nabla_{\nu} n^{\mu} \, q^{\nu}{}_{\alpha} \\ & \mathbf{\Omega}^{(s)} := n \cdot \nabla_{\vec{q}} \, s \end{aligned} \\ & \mathbf{\Omega}^{(\ell)} := \frac{1}{k \cdot \ell} \, k \cdot \nabla_{\vec{q}} \, \ell \end{aligned} \quad \text{or} \quad \Omega^{(\ell)}_{\alpha} := \frac{1}{k_{\rho} \ell^{\rho}} k_{\mu} \nabla_{\nu} \ell^{\mu} \, q^{\nu}{}_{\alpha} \\ & \mathbf{\Omega}^{(k)} := \frac{1}{k \cdot \ell} \, \ell \cdot \nabla_{\vec{q}} \, k \end{aligned}$$

Basic properties of the normal fundamental forms

From the definition: $\Omega^{(s)} = -\Omega^{(n)}$ and $\Omega^{(k)} = -\Omega^{(\ell)} + \mathcal{D}\sigma$

Relation between the (n, s)-type and the (ℓ, k) -type: $\Omega^{(\ell)} = \Omega^{(n)}$ $[\ell = n + s]$ and $\Omega^{(k)} = -\Omega^{(n)}$ [k = n - s]

The normal fundamental forms are not unique

(contrary to the second fundamental tensor \mathcal{K}) Dependence of the normal frame

$$\textcircled{0}(n,s)\mapsto (n',s')\Longrightarrow \boxed{\Omega^{(n')}=\Omega^{(n)}+\mathcal{D}\eta}$$

$$(\ell, k) \mapsto (\ell', k') \Longrightarrow \Omega^{(\ell')} = \Omega^{(\ell)} + \mathcal{D} \ln \lambda$$

"Surface-gravity" 1-forms

If the vector fields (ℓ,k) are extended away from \mathcal{S}_t , define the 1-form

$$\boldsymbol{\kappa}^{(\boldsymbol{\ell})} := \frac{1}{\boldsymbol{k} \cdot \boldsymbol{\ell}} \, \boldsymbol{k} \cdot \boldsymbol{\nabla}_{\boldsymbol{p}} \, \boldsymbol{\ell} \quad \text{ or } \, \kappa_{\alpha}^{(\boldsymbol{\ell})} := \frac{1}{k_{\rho} \ell^{\rho}} k_{\mu} \nabla_{\nu} \ell^{\mu} \, p^{\nu}{}_{\alpha}$$

where p is the orthogonal projector complementary to $ec{q}$: $1 = ec{q} + p$.

NB: Since p is a projector in a direction transverse to S_t , the 1-form $\kappa^{(\ell)}$ is not intrinsic to the 2-surface S_t : it depends on the choice of ℓ away from S_t

"Surface-gravity" 1-forms

If the vector fields (ℓ,k) are extended away from \mathcal{S}_t , define the 1-form

$$\boldsymbol{\kappa}^{(\boldsymbol{\ell})} := \frac{1}{\boldsymbol{k} \cdot \boldsymbol{\ell}} \, \boldsymbol{k} \cdot \boldsymbol{\nabla}_{\boldsymbol{p}} \, \boldsymbol{\ell} \qquad \text{or } \kappa_{\alpha}^{(\boldsymbol{\ell})} := \frac{1}{k_{\rho} \ell^{\rho}} k_{\mu} \nabla_{\nu} \ell^{\mu} \, p^{\nu}{}_{\alpha}$$

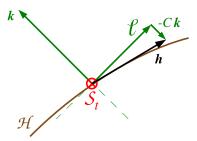

where p is the orthogonal projector complementary to $ec{q}$: $1 = ec{q} + p$.

NB: Since p is a projector in a direction transverse to S_t , the 1-form $\kappa^{(\ell)}$ is not intrinsic to the 2-surface S_t : it depends on the choice of ℓ away from S_t

If ℓ is extended along one of the two families of light rays emanating radially from S_t , then ℓ is pre-geodesic: $\nabla_{\ell} \ell = \nu_{(\ell)} \ell$, with the *inaffinity parameter* (*surface gravity* if ℓ = null Killing vector of Kerr spacetime) given by the 1-form $\kappa^{(\ell)}$ applied to ℓ :

 $u_{(\ell)} = \langle \kappa^{(\ell)}, \ell \rangle$

Normal null frame associated with the evolution vector

The foliation $(S_t)_{t \in \mathbb{R}}$ entirely fixes the ambiguities in the choice of the null normal frame (ℓ, k) , via the evolution vector h: there exists a unique normal null frame (ℓ, k) such that

$$h = \ell - Ck$$
 and $\ell \cdot k = -1$

Concept of black hole viscosity

- Hartle and Hawking (1972, 1973): introduced the concept of **black hole viscosity** when studying the response of the *event horizon* to external perturbations
- Damour (1979): 2-dimensional Navier-Stokes like equation for the event horizon ⇒ shear viscosity and bulk viscosity
- Thorne and Price (1986): membrane paradigm for black holes

Concept of black hole viscosity

- Hartle and Hawking (1972, 1973): introduced the concept of **black hole viscosity** when studying the response of the *event horizon* to external perturbations
- Damour (1979): 2-dimensional **Navier-Stokes** like equation for the event horizon \implies shear viscosity and bulk viscosity
- Thorne and Price (1986): membrane paradigm for black holes

Shall we restrict the analysis to the event horizon ?

Can we extend the concept of viscosity to the local characterizations of black hole recently introduced, i.e. future outer trapping horizons and dynamical horizons ?

NB: *event horizon* = null hypersurface *future outer trapping horizon* = null or spacelike hypersurface *dynamical horizon* = spacelike hypersurface

A D > A B > A B >

Navier-Stokes equation in Newtonian fluid dynamics

$$\rho\left(\frac{\partial v^i}{\partial t} + v^j \nabla_j v^i\right) = -\nabla^i P + \mu \Delta v^i + \left(\zeta + \frac{\mu}{3}\right) \nabla^i (\nabla_j v^j) + f^i$$

or, in terms of fluid momentum density $\pi_i := \rho v_i$,

$$\frac{\partial \pi_i}{\partial t} + v^j \nabla_j \pi_i + \theta \pi_i = -\nabla_i P + 2\mu \nabla^j \sigma_{ij} + \zeta \nabla_i \theta + f_i$$

where θ is the fluid expansion:

$$\theta := \nabla_j v^j$$

and σ_{ij} the velocity shear tensor:

$$\sigma_{ij} := \frac{1}{2} \left(\nabla_i v_j + \nabla_j v_i \right) - \frac{1}{3} \theta \, \delta_{ij}$$

P is the pressure, μ the shear viscosity, ζ the bulk viscosity and f_i the density of external forces

Original Damour-Navier-Stokes equation

Hyp: \mathcal{H} = null hypersurface (particular case: black hole **event horizon**) Then $h = \ell$ (C = 0) reminder Damour (1979) has derived from Einstein equation the relation $\mathcal{L}^{S}\mathcal{L}_{\ell} \, \mathbf{\Omega}^{(\ell)} + \theta^{(\ell)} \mathbf{\Omega}^{(\ell)} = \mathcal{D} \nu_{(\ell)} - \mathcal{D} \cdot \vec{\sigma}^{(\ell)} + rac{1}{2} \mathcal{D} \theta^{(\ell)} + 8\pi \vec{q}^{*} T \cdot \ell$ or equivalently ${}^{\mathcal{S}}\mathcal{L}_{\boldsymbol{\ell}} \, \boldsymbol{\pi} + \theta^{(\boldsymbol{\ell})} \overline{\boldsymbol{\pi}} = -\mathcal{D}P + 2\mu \mathcal{D} \cdot \vec{\boldsymbol{\sigma}}^{(\boldsymbol{\ell})} + \zeta \mathcal{D}\theta^{(\boldsymbol{\ell})} + \boldsymbol{f}$ $\pi := -\frac{1}{2\pi} \Omega^{(\ell)}$ momentum surface density with $P := \frac{\nu_{(\ell)}}{8\pi}$ pressure $\mu := \frac{1}{16\pi}$ shear viscosity $\zeta := -\frac{1}{16\pi}$ bulk viscosity $f := -\vec{q}^*T \cdot \ell$ external force surface density (T = stress-energy tensor)

Original Damour-Navier-Stokes equation (con't)

Introducing a coordinate system (t, x^1, x^2, x^3) such that

• t is compatible with ℓ : $\mathcal{L}_{\ell} t = 1$

• \mathcal{H} is defined by $x^1 = \text{const}$, so that $x^a = (x^2, x^3)$ are coordinates spanning \mathcal{S}_t then

$$\boldsymbol{\ell} = rac{\partial}{\partial t} + \boldsymbol{V}$$

with V tangent to S_t : velocity of \mathcal{H} 's null generators with respect to the coordinates x^a [Damour, PRD 18, 3598 (1978)]. Then

$$\begin{split} \theta^{(\ell)} &= \mathcal{D}_a V^a + \frac{\partial}{\partial t} \ln \sqrt{q} \qquad q := \det q_{ab} \\ \sigma^{(\ell)}_{ab} &= \frac{1}{2} \left(\mathcal{D}_a V_b + \mathcal{D}_b V_a \right) - \frac{1}{2} \theta^{(\ell)} q_{ab} + \frac{1}{2} \frac{\partial q_{ab}}{\partial t} \end{split}$$

Negative bulk viscosity of event horizons

From the Damour-Navier-Stokes equation, $\zeta = -\frac{1}{16\pi} < 0$

This negative value would yield to a *dilation or contraction instability* in an ordinary fluid

It is in agreement with the tendency of a null hypersurface to continually contract or expand

The event horizon is stabilized by the teleological condition imposing its expansion to vanish in the far future (equilibrium state reached)

Generalization to the non-null case

Starting remark: in the null case, ℓ plays two different roles:

- evolution vector along \mathcal{H} (e.g. term ${}^{\mathcal{S}}\mathcal{L}_{\ell}$)
- ullet normal to \mathcal{H} (e.g. term $ec{q}^*T\cdot \ell)$

When ${\mathcal H}$ is no longer null, these two roles have to be taken by two different vectors:

- evolution vector: obviously h reminder
- vector normal to \mathcal{H} : a natural choice is $egin{array}{c} m{m} := m{\ell} + Cm{k} \end{array}$

Generalized Damour-Navier-Stokes equation

Starting point of the calculation: contracted Ricci identity applied to the vector m and projected onto S_t :

$$\left(\nabla_{\mu}\nabla_{\nu}m^{\mu} - \nabla_{\nu}\nabla_{\mu}m^{\mu}\right)q^{\nu}{}_{\alpha} = R_{\mu\nu}m^{\mu}q^{\nu}{}_{\alpha}$$

Final result:

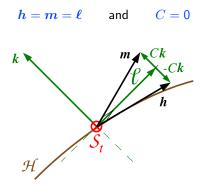

$${}^{\mathcal{S}}\mathcal{L}_{\boldsymbol{h}}\,\boldsymbol{\Omega}^{(\boldsymbol{\ell})} + \theta^{(\boldsymbol{h})}\,\boldsymbol{\Omega}^{(\boldsymbol{\ell})} = \boldsymbol{\mathcal{D}}\langle\boldsymbol{\kappa}^{(\boldsymbol{\ell})},\boldsymbol{h}\rangle - \boldsymbol{\mathcal{D}}\cdot\vec{\boldsymbol{\sigma}}^{(\boldsymbol{m})} + \frac{1}{2}\boldsymbol{\mathcal{D}}\theta^{(\boldsymbol{m})} - \theta^{(\boldsymbol{k})}\boldsymbol{\mathcal{D}}C + 8\pi\vec{\boldsymbol{q}}^{*}\boldsymbol{T}\cdot\boldsymbol{m}$$

- Ω^(ℓ): normal fundamental form of S_t associated with null normal ℓ
 θ^(h), θ^(m) and θ^(k): expansion scalars of S_t along the vectors h, m and k respectively
- \mathcal{D} : covariant derivative within (\mathcal{S}_t, q)
- $\kappa^{(\ell)}$: "surface-gravity" 1-form associated with the null vector ℓ (reminder
- $\sigma^{(m)}$: shear tensor of \mathcal{S}_t along the vector m (reminder
- C : half the scalar square of h (reminder

(a)

Null limit

In the null limit,

and we recover the original Damour-Navier-Stokes equation:

$${}^{\mathcal{S}}\mathcal{L}_{\ell}\,\boldsymbol{\Omega}^{(\ell)} + \theta^{(\ell)}\boldsymbol{\Omega}^{(\ell)} = \mathcal{D}\nu_{(\ell)} - \mathcal{D}\cdot\vec{\boldsymbol{\sigma}}^{(\ell)} + \frac{1}{2}\mathcal{D}\theta^{(\ell)} + 8\pi\vec{q}^{*}\boldsymbol{T}\cdot\boldsymbol{\ell}$$

Case of future trapping horizons

Definition [Hayward, PRD 49, 6467 (1994)] : \mathcal{H} is a future trapping horizon iff $\theta^{(\ell)} = 0$ and $\theta^{(k)} < 0$.

The generalized Damour-Navier-Stokes equation reduces then to

 ${}^{\mathcal{S}}\mathcal{L}_{h}\,\boldsymbol{\Omega}^{(\ell)} + \theta^{(h)}\,\boldsymbol{\Omega}^{(\ell)} = \boldsymbol{\mathcal{D}}\langle \boldsymbol{\kappa}^{(\ell)}, h \rangle - \boldsymbol{\mathcal{D}} \cdot \vec{\boldsymbol{\sigma}}^{(m)} - \frac{1}{2}\boldsymbol{\mathcal{D}}\theta^{(h)} - \theta^{(k)}\boldsymbol{\mathcal{D}}C + 8\pi \vec{\boldsymbol{q}}^{*}\boldsymbol{T} \cdot \boldsymbol{m}$

NB: Notice the change of sign in the $-\frac{1}{2}\mathcal{D}\theta^{(h)}$ term with respect to the original Damour-Navier-Stokes equation \checkmark

Viscous fluid form

$$\begin{split} & S\mathcal{L}_{h} \pi + \theta^{(h)} \pi = -\mathcal{D}P + \frac{1}{8\pi} \mathcal{D} \cdot \vec{\sigma}^{(m)} + \zeta \mathcal{D}\theta^{(h)} + f \end{split}$$
with $\pi := -\frac{1}{8\pi} \Omega^{(\ell)}$ momentum surface density
 $P := \frac{\kappa}{8\pi}$ pressure
 $\frac{1}{8\pi} \sigma^{(m)}$ shear stress tensor
 $\zeta := \frac{1}{16\pi}$ bulk viscosity
 $f := -\vec{q}^{*}T \cdot m + \frac{\theta^{(k)}}{8\pi} \mathcal{D}C$ external force surface density
Similar to the Damour-Navier-Stokes equation for an event horizon \blacktriangleleft predict,
except for
• no Newtonian-fluid relation between *stress* and *strain*: $\sigma^{(m)} \neq 2\mu\sigma^{(h)}$
• positive bulk viscosity

This positive value of bulk viscosity shows that FOTHs and DHs behave as "ordinary" physical objects, in perfect agreement with their local nature

Generalized angular momentum

Definition [Booth & Fairhurst, CQG 22, 4545 (2005)]: Let φ be a vector field on $\mathcal H$ which

- ullet is tangent to \mathcal{S}_t
- has closed orbits
- has vanishing divergence with respect to the induced metric: $\mathcal{D}\cdot arphi=0$

For dynamical horizons, $\theta^{(h)} \neq 0$ and there is a unique choice of φ as the generator (conveniently normalized) of the curves of constant $\theta^{(h)}$ [Hayward, PRD 74, 104013 (2006)]

The generalized angular momentum associated with arphi is then defined by

$$J(\boldsymbol{\varphi}) := -rac{1}{8\pi} \oint_{\mathcal{S}_t} \langle \boldsymbol{\Omega}^{(\boldsymbol{\ell})}, \boldsymbol{\varphi} \rangle^{\,s} \boldsymbol{\epsilon},$$

Remark 1: does not depend upon the choice of null vector ℓ , thanks to the divergence-free property of φ *Remark 2:*

- coincides with Ashtekar & Krishnan's definition for a dynamical horizon
- \bullet coincides with Brown-York angular momentum if ${\mathcal H}$ is timelike and φ a Killing vector

(a)

Angular momentum flux law

Under the supplementary hypothesis that φ is transported along the evolution vector h: $\mathcal{L}_h \varphi = 0$, the generalized Damour-Navier-Stokes equation leads to

$$\frac{d}{dt}J(\boldsymbol{\varphi}) = -\oint_{\mathcal{S}_t} \boldsymbol{T}(\boldsymbol{m},\boldsymbol{\varphi})^{s} \boldsymbol{\epsilon} - \frac{1}{16\pi} \oint_{\mathcal{S}_t} \left[\vec{\boldsymbol{\sigma}}^{(\boldsymbol{m})} : \mathcal{L}_{\boldsymbol{\varphi}} \boldsymbol{q} - 2\theta^{(\boldsymbol{k})} \boldsymbol{\varphi} \cdot \boldsymbol{\mathcal{D}}C\right]^{s} \boldsymbol{\epsilon}$$

[Gourgoulhon, PRD 72, 104007 (2005)]

Angular momentum flux law

Under the supplementary hypothesis that φ is transported along the evolution vector h: $\mathcal{L}_h \varphi = 0$, the generalized Damour-Navier-Stokes equation leads to

$$\frac{d}{dt}J(\boldsymbol{\varphi}) = -\oint_{\mathcal{S}_t} \boldsymbol{T}(\boldsymbol{m},\boldsymbol{\varphi})^{s} \boldsymbol{\epsilon} - \frac{1}{16\pi} \oint_{\mathcal{S}_t} \left[\vec{\boldsymbol{\sigma}}^{(\boldsymbol{m})} : \mathcal{L}_{\boldsymbol{\varphi}} \boldsymbol{q} - 2\theta^{(\boldsymbol{k})} \boldsymbol{\varphi} \cdot \boldsymbol{\mathcal{D}}C\right]^{s} \boldsymbol{\epsilon}$$

[Gourgoulhon, PRD 72, 104007 (2005)]

Two interesting limiting cases:

Starting point

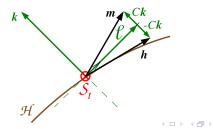

From the Einstein equation, one can derive the following evolution law for any foliated hypersurface \mathcal{H} [Gourgoulhon & Jaramillo, PRD 74, 087502 (2006)] :

$$\mathcal{L}_{h} \theta^{(m)} = \kappa \theta^{(h)} - \frac{1}{2} \theta^{(h)} \theta^{(m)} - \sigma^{(h)} : \sigma^{(m)} - 8\pi T(m, h)$$

$$+ \theta^{(k)} \mathcal{L}_{h} C + \mathcal{D} \cdot \left(2C \vec{\Omega}^{(\ell)} - \vec{\mathcal{D}}C \right)$$

where κ is the component along ℓ of the "acceleration" of h in the decomposition

$$\nabla_h h = \kappa \ell + (C\kappa - \mathcal{L}_h C)k - \mathcal{D}C$$

Two special cases

• null hypersurface (event horizon) : $h = m = \ell$ and C = 0:

$$\mathcal{L}_{\boldsymbol{\ell}} \, \theta^{(\boldsymbol{\ell})} + (\theta^{(\boldsymbol{\ell})})^2 - \kappa \, \theta^{(\boldsymbol{\ell})} = \frac{1}{2} (\theta^{(\boldsymbol{\ell})})^2 - \boldsymbol{\sigma}^{(\boldsymbol{\ell})} : \boldsymbol{\sigma}^{(\boldsymbol{\ell})} - 8\pi \boldsymbol{T}(\boldsymbol{\ell}, \boldsymbol{\ell})$$

 \rightarrow this is the null Raychaudhuri equation

• FOTH : $\theta^{(\ell)} = 0 \Rightarrow \theta^{(m)} = -\theta^{(h)}$:

$$\mathcal{L}_{h} \theta^{(h)} + (\theta^{(h)})^{2} + \kappa \theta^{(h)} = \frac{1}{2} (\theta^{(h)})^{2} + \sigma^{(h)} : \sigma^{(m)} + 8\pi T(m, h) - \theta^{(k)} \mathcal{L}_{h} C + \mathcal{D} \cdot \left(\vec{\mathcal{D}} C - 2C \vec{\Omega}^{(\ell)} \right)$$

Notice the change of signs between the two cases

Energy equation

For a event horizon, Price and Thorne (1986) have defined the surface energy density as $\varepsilon := -\frac{1}{8\pi} \theta^{(\ell)}$

By analogy, define the surface energy density of a FOTH as

$$\varepsilon := -\frac{1}{8\pi} \theta^{(\boldsymbol{m})}$$

Then the above evolution equation becomes

 $\mathcal{L}_{h} \varepsilon + (\varepsilon + P)\theta^{(h)} = \frac{1}{8\pi} \sigma^{(h)} : \sigma^{(m)} + \zeta(\theta^{(h)})^{2} - \mathcal{D} \cdot Q + \mathcal{R}$ [Gourgoulhon & Jaramillo, PRD 74, 087502 (2006)] with $P := \frac{\kappa}{8\pi}$ pressure, $\frac{1}{8\pi} \sigma^{(m)}$ shear stress tensor $\sigma^{(h)}$ shear strain tensor, $\zeta := \frac{1}{16\pi} > 0$ bulk viscosity $Q := \frac{1}{4\pi} \left[C \vec{\Omega}^{(\ell)} - \frac{1}{2} \vec{\mathcal{D}} C \right]$ heat flux $\mathcal{R} = T(m, h) - \frac{\theta^{(k)}}{8\pi} \mathcal{L}_{h} C$ external energy production rate

We recover the positiveness of the bulk viscosity for a FOTH
