What is a gravitational wave?

A **gravitational wave** is a perturbation in the **curvature of spacetime** that propagates at the vacuum speed of light

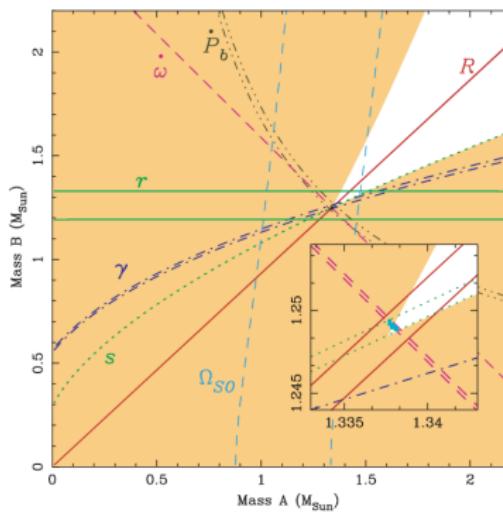

Key prediction of Einstein's theory of General Relativity

Indirect evidence of gravitational waves

Binary pulsar PSR B1913+16
[Hulse & Taylor, ApJ (1975)]

Double pulsar PSR J0737-3039
[Burgay et al., Nature (2003)]

Orbital decay due to GW emission confirmed at the **0.1% level**

The gravitational wave spectrum

Science with gravitational wave observations

Fundamental physics

- Precision tests of GR in the non-linear regime
- Existence of black holes — cosmic censorship
- Dark energy equation of state $w = p/\rho$

Astrophysics

- Formation and evolution of compact binaries
- Origin and mechanism of γ -ray bursts
- Internal structure of neutron stars

Cosmology

- Cosmography and independent measure of H_0
- Origin and growth of supermassive black holes
- Phase transitions in the early Universe

Ground-based laser interferometric detectors

Virgo (Cascina, Italy)

LIGO (Livingston, USA)

- 6 science runs and ~ 80 publications over 2003–2012
- No direct detection but stringent upper limits, e.g.
 - Ellipticity of Crab pulsar $< 10^{-4}$ [Abbott et al., ApJ (2008)]
 - Energy density of GW stochastic background $< 6.9 \times 10^{-6}$ around 100 Hz [Abbott et al., Nature (2009)]

A worldwide network of GW observatories

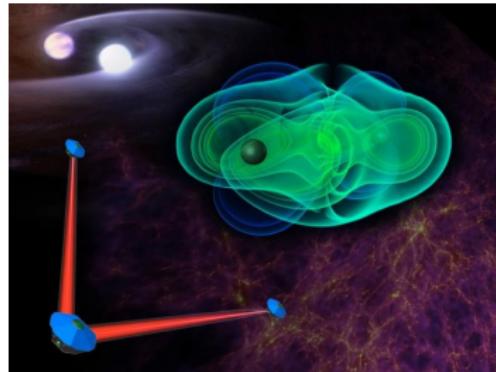

- Ongoing upgrade to Advanced LIGO/Virgo, KAGRA in Japan
- 2nd generation detectors: sensitivity $\times 10 \Rightarrow$ event rates $\times 10^3$
- Beginning of gravitational wave astronomy $\sim 2015\text{-}2020$

eLISA: a gravitational wave antenna in space

LISA Pathfinder

eLISA/NGO

- LISA Pathfinder scheduled for launch in 2015
- “**Gravitational Universe**” science theme was selected by ESA for the L3 mission with a nominal launch in 2034
- If LISA Pathfinder is successful then **eLISA should fly!**

Main sources of GW for LIGO/Virgo and eLISA

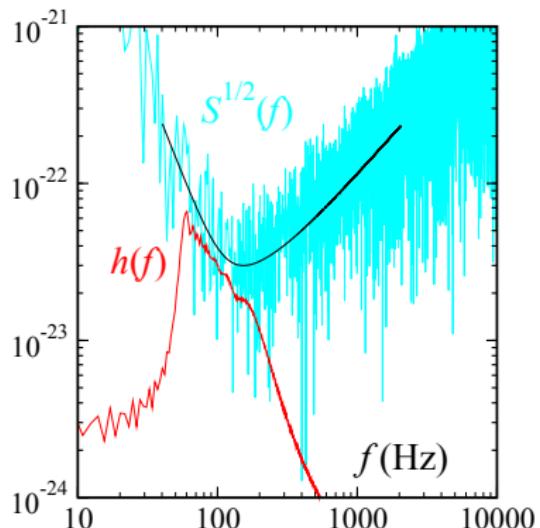

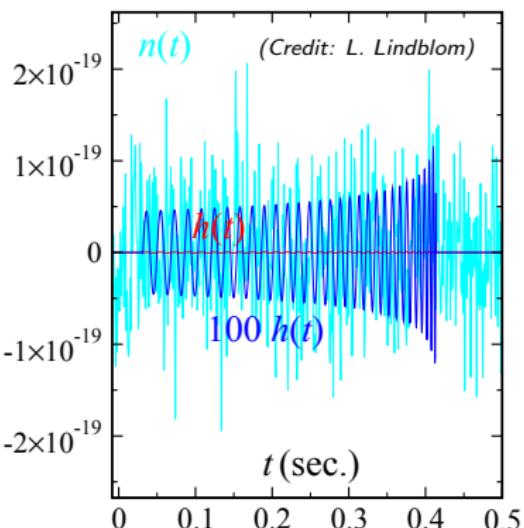

- Binary neutron stars ($2 \times \sim 1.4 M_{\odot}$)
- Stellar mass black hole binaries ($2 \times \sim 10 M_{\odot}$)
- Supermassive black hole binaries ($2 \times \sim 10^6 M_{\odot}$)
- Extreme mass ratio inspirals ($\sim 10 M_{\odot} + \sim 10^6 M_{\odot}$)

Need for highly accurate template waveforms

If the expected signal is *known in advance* then $n(t)$ can be filtered and $h(t)$ recovered by **matched filtering** → **template waveforms**

Need for highly accurate template waveforms

Comparing the predictions from these various methods

Why?

- Independent checks of long and complicated calculations
- Identify domains of validity of approximation schemes
- Extract information inaccessible to other methods
- Develop a universal model for compact binaries

Comparing the predictions from these various methods

Why?

- Independent checks of long and complicated calculations
- Identify domains of validity of approximation schemes
- Extract information inaccessible to other methods
- Develop a universal model for compact binaries

How?

- ✗ Use the same coordinate system in all calculations
- ✓ Using coordinate-invariant relationships

Comparing the predictions from these various methods

Why?

- Independent checks of long and complicated calculations
- Identify domains of validity of approximation schemes
- Extract information inaccessible to other methods
- Develop a universal model for compact binaries

How?

- ✗ Use the same coordinate system in all calculations
- ✓ Using coordinate-invariant relationships

What?

- Gravitational waveforms at null infinity
- Conservative effects on the orbital dynamics

Revisiting the classical tests of General Relativity

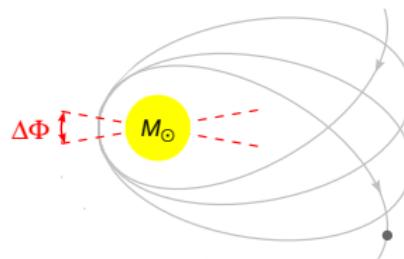

- Gravitational redshift of light

$$\frac{\Delta\tau}{\Delta t} = 1 - \frac{G}{c^2} \frac{M_\odot}{R_\odot}$$

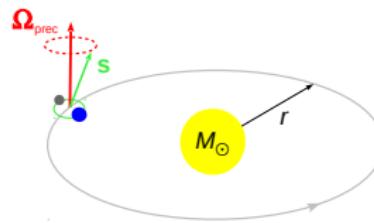

- Perihelion advance of Mercury

$$\Delta\Phi = \frac{G}{c^2} \frac{6\pi M_\odot}{a(1-e^2)}$$

- Precession of Earth-Moon spin

$$\Omega_{\text{prec}} = \frac{G}{c^2} \mathbf{v} \times \nabla \left(\frac{3M_\odot}{2r} \right)$$

Post-Newtonian expansions and black hole perturbations

The “redshift observable” for circular orbits

- It measures the **redshift** of light emitted from the point particle:

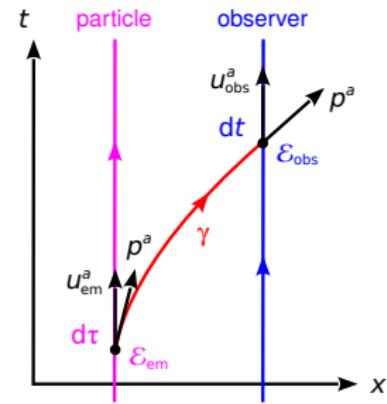

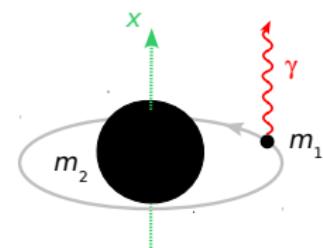

$$\frac{\mathcal{E}_{\text{obs}}}{\mathcal{E}_{\text{em}}} = \frac{(p^a u_a)_{\text{obs}}}{(p^a u_a)_{\text{em}}} = z$$

- It is a **constant of the motion** associated with the helical Killing field:

$$z = -k^a u_a$$

- In coordinates adapted to the symmetry:

$$z = \frac{d\tau}{dt} = \frac{1}{u^t}$$

De Sitter's spin precession, or geodetic effect

- In 1916 de Sitter showed that, to leading order, a system's spin \mathbf{s} precesses at

$$\Omega_{\text{prec}} \simeq \frac{3}{2} \mathbf{v} \times \nabla \Phi, \quad \Phi \equiv \frac{GM}{c^2 r} \ll 1$$

- Precession of Earth-Moon spin axis of $\sim 1.9''/\text{cent}$. confirmed using LLR data
- Precession of test gyro on polar Earth orbit of $\sim 6.6''/\text{yr}$ confirmed by GPB
- Geodetic spin precession of $\sim 5^\circ/\text{yr}$ measured in the double pulsar

Geodetic precession in black hole binaries

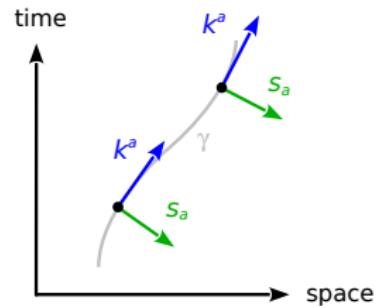

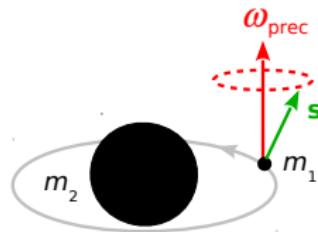

- A test spin s_a is parallel-transported along a geodesic γ with unit tangent u^a :

$$u^b \nabla_b s_a = 0 \iff \frac{ds}{d\tau} = \omega_{\text{prec}} \times s$$

- For a circular orbit with a helical Killing field k^a such that $k^a|_\gamma = u^a$,

$$\omega_{\text{prec}}^2 = \frac{1}{2} (\nabla_a k_b \nabla^a k^b)|_\gamma$$

- Compute $\psi \equiv 1 - \omega_{\text{prec}}/u^\phi$, the angle of spin precession per radian of revolution

- ④ Geodetic spin precession
- ⑤ Relativistic periastron advance

Relativistic perihelion advance of Mercury

- Observed anomalous advance of Mercury's perihelion of $\sim 43''/\text{cent}$.
- Accounted for by the leading-order relativistic angular advance per orbit

$$\Delta\Phi = \frac{6\pi GM_{\odot}}{c^2 a (1 - e^2)}$$

- Periastron advance of $\sim 4^\circ/\text{yr}$ now measured in **binary pulsars**

Periastron advance in black hole binaries

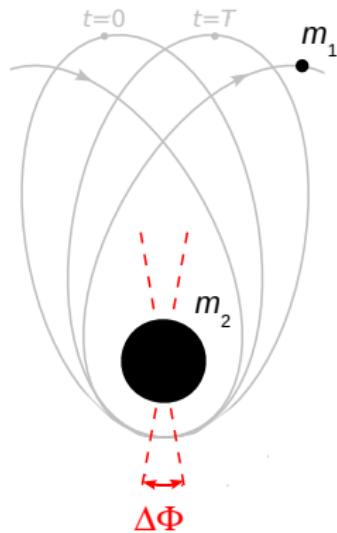

- Generic non-circular orbit parametrized by the two frequencies

$$\Omega_r = \frac{2\pi}{T}, \quad \Omega_\varphi = \frac{1}{T} \int_0^T \dot{\varphi}(t) dt$$

- Periastron advance per radial period

$$K \equiv \frac{\Omega_\varphi}{\Omega_r} = 1 + \frac{\Delta\Phi}{2\pi}$$

- In the **circular** orbit limit $e \rightarrow 0$, the relation $K(\Omega_\varphi)$ is coordinate-invariant

Using perturbation theory for comparable-mass binaries

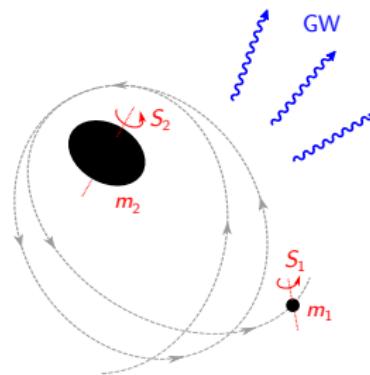

Using perturbation theory for comparable-mass binaries

Why?

- Results valid in the weak-field and **strong-field** regimes
- Solve “only” **linear** partial differential equations
- Results may be valid for **all mass ratios**

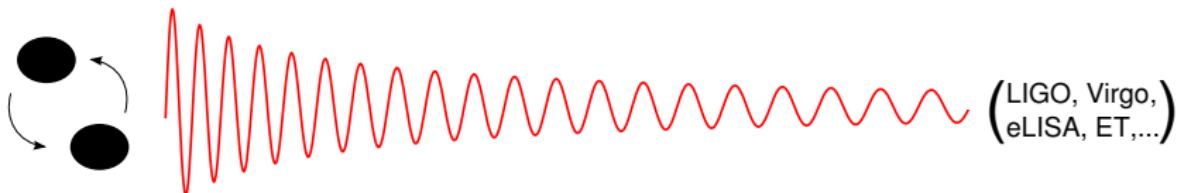

How?

- **Comparisons** with NR
- Inclusion of **spin effects**
- Extension of the **first law**
- Computation of **GW fluxes**

Summary and prospects

- Observing GWs will **open a new window** on the Universe
- Highly accurate template waveforms are a **prerequisite** for doing science with GW observations
- It is **crucial to compare** the predictions from PN theory, perturbation theory and numerical relativity
- Perturbation theory may prove useful to build templates for **comparable-mass** binaries (LIGO/Virgo and eLISA)

The dark matter problem in astrophysics

Model of dipolar dark matter [Blanchet & Le Tiec, PRD (2008; 2009)]

- General Relativity + **modified dark matter**
- Equivalent to Λ CDM model on cosmological scales
- Reproduces phenomenology of **MOND** at galactic scale

Predictions and comparisons to observations

- **Non-gaussianity** in cosmic microwave background → Planck [Blanchet, Langlois, Le Tiec & Marsat, JCAP (2013)]
- Stochastic background of **gravitational waves** → LIGO, eLISA [Birnbaum, Gerling-Dunsmore & Le Tiec (work in progress)]
- **Intensive numerical simulations** to study growth of structures in non-linear regime → 2dF, SDSS [With COS group at LUTh?]
