Isochrony in 3D radial potentials

Isochrone relativity

Kepler's third law

Self-gravitating dynamics

#### Isochrone potentials

Energy:

$$E = m\xi = \frac{1}{2}m\left[\left(\frac{\mathrm{d}r}{\mathrm{d}t}\right)^2 + \frac{\Lambda^2}{2r^2}\right] + m\psi$$

provides the radial equation of motion in the trajectory plane given by  $\Lambda$  :

$$\frac{1}{2}\left(\frac{\mathrm{d}r}{\mathrm{d}t}\right)^2 + \frac{\Lambda^2}{2r^2} - (\xi - \psi) = 0 \tag{M}$$

Isochrony in 3D radial potentials

Isochrone relativity

Kepler's third law

Self-gravitating dynamics

#### Isochrone potentials

Radial equation of motion in the trajectory plane given by  $\boldsymbol{\Lambda}$  :

$$\frac{1}{2}\left(\frac{\mathrm{d}r}{\mathrm{d}t}\right)^2 + \frac{\Lambda^2}{2r^2} - (\xi - \psi) = 0 \tag{M}$$

$$\frac{1}{2}\left(\frac{\mathrm{d}r}{\mathrm{d}t}\right)^2 + \frac{\Lambda^2}{2r^2} - (\xi - \psi) = 0 \tag{M}$$

For a given ψ, the set of radially periodic orbits is given by

 $\Theta_{\psi} = \left\{ (\xi, \Lambda) \in \mathbb{R}^2, \text{ s.t. } r(\cdot) \text{ solving (M) and periodic} \right\}.$ 

Isochrony in 3D radial potentials

#### Theorem

There are four types of isochrone potentials:  $\psi_{ke}$ ,  $\psi_{ha}$ ,  $\psi_{he}$  and  $\psi_{bo}$ . Any isochrone potential is in the group orbit of { $\psi_{ke}$ ,  $\psi_{ha}$ ,  $\psi_{he}$ ,  $\psi_{bo}$ } under the group action of  $\mathbb{A} = \{\epsilon - transvections, \Lambda - translations\}$ .

Isochrony in 3D radial potentials

Isochrone relativity

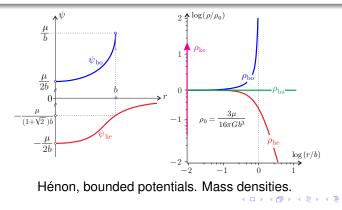

Kepler's third law

イロト イポト イヨト イヨト

Self-gravitating dynamics

# Bolsts

#### Theorem

When  $\alpha\beta\xi' \neq 0$ , the image of a keplerian PRO by  $B_{\alpha,\beta}$  is an isochrone orbit, with, given  $\chi = \frac{p\alpha |\xi|}{u\beta}$ , the non-linear relations  $(r')^2 = \frac{\alpha \xi r^2 - \mu \beta r}{\xi'},$  $\varphi'(\varphi) = \frac{\varphi}{2} + \frac{\chi}{\sqrt{(1+\chi)^2 - e^2}} \arctan\left[\sqrt{\frac{1+\chi-e}{1+\chi+e}} \tan\left(\frac{\varphi}{2}\right)\right].$ Isochrone Bolsted Orbit Kepler Primary

## *i*Bolsts

Partial exchange  $\xi x \leftrightarrow Y(x)$  preserving isochrony ?

$$\frac{1}{16} \left(\frac{dx}{dt}\right)^2 + \Lambda^2 = \xi x - Y(x), \qquad \frac{1}{16} \left(\frac{dx'}{dt'}\right)^2 + \left(\Lambda'\right)^2 = \xi' x' - Y'(x')$$

Symmetric linear exchanges between  $\xi x$  and y:

$$\begin{pmatrix} \xi'x'\\ y' \end{pmatrix} = \underbrace{\frac{1}{2} \begin{bmatrix} \gamma+1 & \gamma-1\\ \gamma-1 & \gamma+1 \end{bmatrix}}_{B_{\gamma}} \begin{pmatrix} \xi x\\ y \end{pmatrix},$$

where  $B_{\gamma}$  invertible  $\Leftrightarrow \gamma = \alpha + \beta \neq 0$ .

Isochrone relativity

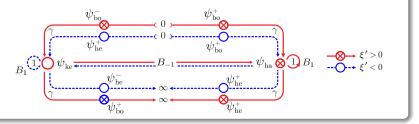

Kepler's third law

Self-gravitating dynamics

## Keplerian *i* Bolst group orbit

#### Proposition

Any isochrone potential is in the group orbit of the kepler potential under the action of the *i* Bolst group  $\mathbb{B} = \{B_{\gamma}, \gamma \in \mathbb{R}^*\}$ .

Isochrony in 3D radial potentials

Isochrone relativity

Kepler's third law

Self-gravitating dynamics

## *i*Bolsts

Additive representation of  $\mathbb{B}$ :

$$B_{\chi} = e^{\chi} \begin{bmatrix} \cosh(\chi) & \sinh(\chi) \\ \sinh(\chi) & \cosh(\chi) \end{bmatrix} \quad \text{when } \gamma > 0,$$

with  $\gamma = e^{2\chi}$ .

Isochrone relativity 

### Reference frames

#### Definition

The reference frame of a given parabola  $\mathcal{P}$  is the frame  $(O, \mathbf{t}, \mathbf{n})$  where the tangent to the parabola at the origin is  $\mathcal{T}_{O}(\mathcal{P}) = \mathbb{R}\mathbf{t}$  and the symmetry axis is  $\mathcal{S}(\mathcal{P}) = \mathbb{R}\mathbf{n}$ .

Self-gravitating dynamics

## Isochrony is keplerian in reference frames

#### Theorem

An orbit is isochrone  $\Leftrightarrow$  it is the *i* Bolsted image of a keplerian orbit.

Isochrony in 3D radial potentials

Isochrone relativity

Kepler's third law

Self-gravitating dynamics

## *i* Bolsts . . .

Consider 
$$\mathbf{k} = \frac{1}{\sqrt{2}} (\mathbf{i} - \mathbf{j})$$
 and  $\mathbf{l} = \frac{1}{\sqrt{2}} (\mathbf{i} + \mathbf{j})$  the two eigenvectors of the  $\mathbf{i}$  Bolst  $B_{\gamma}$  such that

 $B_{\gamma}(\mathbf{k}) = \mathbf{k}$  and  $B_{\gamma}(\mathbf{l}) = \gamma \mathbf{l}$ .

With the affine coordinates system  $(w_1 = \xi x, w_2 = y)$  and setting  $\mathbf{w}' = B_{\gamma}(\mathbf{w})$ , then

$$\begin{cases} \xi'x'-y'=\xi x-y\\ \xi'x'+y'=\gamma(\xi x+y) \end{cases} \implies (\xi'x')^2-y'^2=\gamma\Big[(\xi x)^2-y^2\Big].$$

# Isochrone relativity and special relativity

### Isochrone principle of relativity

In the canonical frame  $\mathcal{R}_{\mathcal{O}}$ , with proper time  $d\tau = \xi dt$ , a keplerian orbit  $(\xi, \Lambda^2)$  in the affine coordinates  $(\xi x, y)$  verifies

$$\frac{1}{16} \left[ \frac{d}{d\tau} \left( \mathbf{w} | i \right) \right]^2 = \left( \mathbf{w} | i - j \right) + \left( \mathbf{w}_{\Lambda} | j \right)$$

where  $\mathbf{w}_{\Lambda} = -\Lambda^2 j$ .

In the bolsted frame  $\mathcal{R}'_{O}$  with affine coordinates  $(\xi' x', y')$  and proper time  $d\tau' = \xi' dt'$ , the bolsted orbital differential equation reads

$$\frac{1}{16} \left[ \frac{d}{d\tau'} \left( \mathbf{w}' | \mathbf{u} \right) \right]^2 = \left( \mathbf{w}' | \mathbf{u} - \mathbf{v} \right) + \left( \mathbf{w}'_{\Lambda} | \mathbf{v} \right)$$

with  $\mathbf{w}'_{\Lambda} = -\Lambda^2 \mathbf{v}$ .

### Kepler's third law for isochrones

### Theorem

For any radially period orbit in an isochrone potential, the square of the radial period is proportional to the cube of the isochrone semi major axis:

$$\tau_r^2 = \frac{4\pi^2}{\mu}a^3$$

where  $\mu$  is the mass parameter of  $\psi_{ke}$ ,  $\psi_{he}$ ,  $\psi_{bo}$  and  $\mu = \omega^2 R^3$  for  $\psi_{ha}^R$ .

# Conclusion

- Geometrical characterization and classification of the completed isochrone set.
- Generalization of Bohlin transformation:  $(\xi_{iso}, \psi_{iso}) \stackrel{B_{\gamma}}{\leftrightarrow} (\xi_{ke}, \psi_{ke})$
- Isochrone relativity: any isochrone is keplerian in his reference frame.
- Consequences: generalized Kepler's Third Law, Bertrand's theorem.
- Isochrone analysis: SGS are dynamically isochrone after gravitational collapse.
