# SageMath in a few words

**SageMath** (*nickname: Sage*) is a **free open-source** computer algebra system initiated by **William Stein** in 2005

# SageMath in a few words

**SageMath** (*nickname: Sage*) is a **free open-source** computer algebra system initiated by **William Stein** in 2005

SageMath is free (GPL v2)

Freedom means

- 1 everybody can use it, by download from <https://www.sagemath.org>
- 2 everybody can examine the source code and improve it

# SageMath in a few words

**SageMath** (nickname: **Sage**) is a **free open-source** computer algebra system initiated by **William Stein** in 2005

## SageMath is free (GPL v2)

Freedom means

- 1 everybody can use it, by download from <https://www.sagemath.org>
- 2 everybody can examine the source code and improve it

## SageMath is based on Python

- no need to learn any specific syntax to use it
- Python is a powerful *object oriented language*, with a neat syntax
- SageMath benefits from the Python ecosystem (e.g. **Jupyter notebook**, **NumPy**, **Matplotlib**)

# SageMath in a few words

# Current status

Already present (SageMath 10.3):

- **differentiable manifolds**: tangent spaces, vector frames, tensor fields, curves, pullback and pushforward operators, submanifolds
- **vector bundles** (tangent bundle, tensor bundles)
- **standard tensor calculus** (tensor product, contraction, symmetrization, etc.), even on non-parallelizable manifolds, and with all **monoterm tensor symmetries** taken into account
- **Lie derivative** along a vector field
- **differential forms**: exterior and interior products, exterior derivative, Hodge duality
- **multivector fields**: exterior and interior products, Schouten-Nijenhuis bracket
- **affine connections** (curvature, torsion)
- **pseudo-Riemannian metrics**
- **computation of geodesics** by numerical integration (*thanks to Karim!*)

# Current status

Already present (*cont'd*):

- some **plotting capabilities** (charts, points, curves, vector fields)
- **parallelization** (on tensor components) of CPU demanding computations
- **extrinsic geometry** of pseudo-Riemannian submanifolds
- **series expansions** of tensor fields
- **symplectic manifolds**
- 2 symbolic backends: **Pynac/Maxima** (SageMath's default) and **SymPy**

Future prospects:

- more symbolic backends (Giac, FriCAS, ...)
- more graphical outputs
- spinors, integrals on submanifolds, variational calculus, etc.
- **connection with numerical relativity**: use SageMath to explore numerically-generated spacetimes

# Outline

- 1 SageMath and its differential geometry capabilities
- 2 SageMath implementation of tensor fields**
- 3 Example: Einstein constraints in Kerr spacetime
- 4 Other examples
- 5 Conclusions

# Vector fields on a smooth manifold

The set  $\mathfrak{X}(M)$  of vector fields on a smooth manifold  $M$  over  $\mathbb{K} = \mathbb{R}$  or  $\mathbb{K} = \mathbb{C}$  is endowed with two algebraic structures:

- 1  $\mathfrak{X}(M)$  is an **infinite-dimensional vector space over  $\mathbb{K}$** , the scalar multiplication  $\mathbb{K} \times \mathfrak{X}(M) \rightarrow \mathfrak{X}(M)$ ,  $(\lambda, \mathbf{v}) \mapsto \lambda \mathbf{v}$  being defined by

$$\forall p \in M, \quad (\lambda \mathbf{v})|_p = \lambda \mathbf{v}|_p,$$

- 2  $\mathfrak{X}(M)$  is a **module over the commutative algebra  $C^\infty(M)$** , the scalar multiplication  $C^\infty(M) \times \mathfrak{X}(M) \rightarrow \mathfrak{X}(M)$ ,  $(f, \mathbf{v}) \mapsto f \mathbf{v}$  being defined by

$$\forall p \in M, \quad (f \mathbf{v})|_p = f(p) \mathbf{v}|_p,$$

the right-hand side involving the scalar multiplication by  $f(p) \in \mathbb{K}$  in the vector space  $T_p M$ .

$\mathfrak{X}(M)$  as a  $C^\infty(M)$ -module

$\mathfrak{X}(M)$  is a **free module** over  $C^\infty(M) \iff \mathfrak{X}(M)$  admits a basis

If this occurs, then  $\mathfrak{X}(M)$  is actually a **free module of finite rank** over  $C^\infty(M)$  and  $\text{rank } \mathfrak{X}(M) = \dim M = n$ .

One says then that  $M$  is a **parallelizable** manifold.

A basis  $(e_a)_{1 \leq a \leq n}$  of  $\mathfrak{X}(M)$  is called a **vector frame**

Basis expansion<sup>1</sup>:

$$\forall v \in \mathfrak{X}(M), \quad v = v^a e_a, \quad \text{with } v^a \in C^\infty(M) \quad (1)$$

At each point  $p \in M$ , (1) gives birth to an identity in the tangent space  $T_p M$ :

$$v|_p = v^a(p) e_a|_p, \quad \text{with } v^a(p) \in \mathbb{K},$$

which is nothing but the expansion of the tangent vector  $v|_p$  on the basis  $(e_a|_p)_{1 \leq a \leq n}$  of the vector space  $T_p M$ .

<sup>1</sup>Einstein's convention for summation on repeated indices is assumed. 

# Parallelizable manifolds

$M$  is **parallelizable**  $\iff$   $\mathfrak{X}(M)$  is a free  $C^\infty(M)$ -module of rank  $n$   
 $\iff$   $M$  admits a global vector frame  
 $\iff$  the tangent bundle is trivial:  $TM \simeq M \times \mathbb{K}^n$

# Parallelizable manifolds

$M$  is **parallelizable**  $\iff \mathfrak{X}(M)$  is a free  $C^\infty(M)$ -module of rank  $n$   
 $\iff M$  admits a global vector frame  
 $\iff$  the tangent bundle is trivial:  $TM \simeq M \times \mathbb{K}^n$

## Examples of parallelizable manifolds

- $\mathbb{R}^n$  (global coordinate chart  $\Rightarrow$  global vector frame)
- the circle  $\mathbb{S}^1$  (*rem*: no global coordinate chart)
- the torus  $\mathbb{T}^2 = \mathbb{S}^1 \times \mathbb{S}^1$
- the 3-sphere  $\mathbb{S}^3 \simeq \text{SU}(2)$ , as any Lie group
- the 7-sphere  $\mathbb{S}^7$
- any orientable 3-manifold (Steenrod theorem)

# Parallelizable manifolds

$M$  is **parallelizable**  $\iff \mathfrak{X}(M)$  is a free  $C^\infty(M)$ -module of rank  $n$   
 $\iff M$  admits a global vector frame  
 $\iff$  the tangent bundle is trivial:  $TM \simeq M \times \mathbb{K}^n$

## Examples of parallelizable manifolds

- $\mathbb{R}^n$  (global coordinate chart  $\Rightarrow$  global vector frame)
- the circle  $\mathbb{S}^1$  (*rem*: no global coordinate chart)
- the torus  $\mathbb{T}^2 = \mathbb{S}^1 \times \mathbb{S}^1$
- the 3-sphere  $\mathbb{S}^3 \simeq \text{SU}(2)$ , as any Lie group
- the 7-sphere  $\mathbb{S}^7$
- any orientable 3-manifold (Steenrod theorem)

## Examples of non-parallelizable manifolds

- the sphere  $\mathbb{S}^2$  (hairy ball theorem!) and any  $n$ -sphere  $\mathbb{S}^n$  with  $n \notin \{1, 3, 7\}$
- the real projective plane  $\mathbb{R}\mathbb{P}^2$

# SageMath implementation of vector fields

Choice of the  $C^\infty(M)$ -module point of view for  $\mathfrak{X}(M)$ , instead of the infinite-dimensional  $\mathbb{K}$ -vector space one

⇒ implementation advantages:

- reduction to **finite-dimensional structures**: free  $C^\infty(U)$ -modules of rank  $n$  on parallelizable open subsets  $U \subset M$
- for tensor calculus on each parallelizable open set  $U$ , use of exactly the same **FiniteRankFreeModule** code as for tangent spaces

# SageMath implementation of vector fields

Choice of the  $C^\infty(M)$ -module point of view for  $\mathfrak{X}(M)$ , instead of the infinite-dimensional  $\mathbb{K}$ -vector space one

⇒ implementation advantages:

- reduction to **finite-dimensional structures**: free  $C^\infty(U)$ -modules of rank  $n$  on parallelizable open subsets  $U \subset M$
- for tensor calculus on each parallelizable open set  $U$ , use of exactly the same **FiniteRankFreeModule** code as for tangent spaces

## Decomposition of $M$ into parallelizable parts

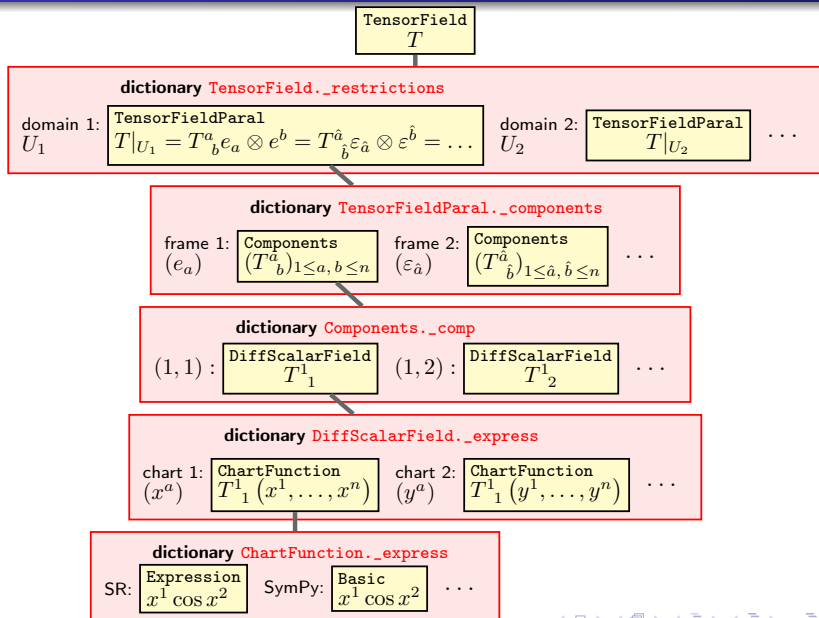

**Assumption**: the smooth manifold  $M$  can be covered by a finite number  $m$  of parallelizable open subsets  $U_i$  ( $1 \leq i \leq m$ )

**Example**: this holds if  $M$  is compact (finite atlas)

More details on the implementation:

[E. Gourgoulhon & M. Mancini, *Les cours du CIRM* 6, 1 (2018)]
